# Semigroup Identities of Tropical Matrices

Zur Izhakian

### Semigroup Identities

Let  ${\mathcal A}$  be a countably infinite set of "letters" – an alphabet.

 $\mathcal{A}^+ := (\mathcal{A}^+, \circ)$  is the free semigroup generated by  $\mathcal{A}$ , where  $\circ$  is concatenation. Its elements are called words.

Def. A semigroup identity is a formal equality

 $\Pi: u = v,$ 

where u and v are elements (words) of the free semigroup  $A^+$ . (For a monoid identity, we allow u and v to be the empty word.)

<ロト < 団 ト < 臣 ト < 臣 ト 三 2/35

### Semigroup Identities

A semigroup  $S := (S, \cdot)$  satisfies a semigroup identity  $\Pi : u = v$ , if  $\varphi(u) = \varphi(v)$  for every morphism  $\varphi : \mathcal{A}^+ \to S$ .

**Prop.** A semigroup that satisfies an *n*-letter identity,  $n \ge 2$ , also satisfies a 2-letter identity of the same length.

For  $\mathcal{A} = \{a, b\}$ , S satisfies an identity  $\Pi : u = v$ , written  $\langle u, v \rangle \in \mathrm{Id}(S)$ , if

$$u \llbracket s', s'' \rrbracket = v \llbracket s', s'' \rrbracket, \qquad a := s', \ b := s'',$$

for any  $s', s'' \in S$ .

### Semigroup Identities: Examples

- A commutative semigroup satisfies the identity  $\Pi : ab = ba$ , written  $ab [\![s', s'']\!] = ba [\![s', s'']\!]$ .
- Any idempotent semigroup satisfies the identity  $\Pi: a^n = a^m$  for any  $n, m \in \mathbb{N}$ .
- The semigroup

$$S = \left\{ \left( \begin{array}{cc} 0 & 0 \\ 0 & 0 \end{array} \right), \left( \begin{array}{cc} 1 & 0 \\ 0 & 1 \end{array} \right), \left( \begin{array}{cc} 0 & 1 \\ 1 & 0 \end{array} \right) \right\}$$

<ロ > < 団 > < 臣 > < 臣 > 王 > 2000 4/35

of  $2 \times 2$  boolean matrices satisfies the identity  $\Pi : a^2b^2 = b^2a^2$ , written  $a^2b^2 \llbracket s', s'' \rrbracket = b^2a^2 \llbracket s', s'' \rrbracket$ .

# Semigroup Identities: Groups

- Gromov's theory implies that every finitely generated group having polynomial growth satisfies a nontrivial semigroup identity (since it is virtually nilpotent).
- Shneerson gave examples that show that this does not hold for semigroups.

<ロト<団ト<臣ト<臣ト 5/35

# Semigroup Identities: Semigroups

Qu. Given an identity  $\Pi : u = v$  and a semigroup  $S := (S, \cdot)$ , does S satisfy the identity  $\Pi$ ?

#### Possible approach for solution:

Use a faithful linear representation

$$\rho: S \longrightarrow M_n(\mathbb{T}),$$

where  $M_n(\mathbb{T})$  is the monoid of  $n \times n$  tropical matrices, and then prove the identity for the image of S.

*Qu.* Does the monoid  $M_n(\mathbb{T})$  satisfy a nontrivial identity?

## The Tropical Semiring

A semiring  $(R, +, \cdot)$  is a set R equipped with two binary operations + and  $\cdot$ , called addition and multiplication, such that  $(R, \cdot)$  is a monoid and (R, +) is a commutative monoid, with distributivity of multiplication over addition on both sides.

The **tropical semiring**  $\mathbb{T} := \mathbb{R} \cup \{-\infty\}$  is the set of real numbers, equipped with the operations of maximum and summation

$$a \lor b := \max\{a, b\}, \quad a \cdot b := a + b,$$

providing respectively the addition and multiplication.

 $\mathbb{T} := (\mathbb{T}, \lor, \cdot)$  is a commutative idempotent semiring whose unit is "1" := 0 and whose zero is "0" :=  $-\infty$ .

< □ > < @ > < E > < E > E 2/35

Matrices over the tropical semiring  $\mathbb{T}$  are defined in the standard way. They form the semiring  $M_n(\mathbb{T})$ , whose addition and multiplication are induced by the operations of  $\mathbb{T}$ .

The unit matrix of  $M_n(\mathbb{T})$  is the matrix

$$I = \begin{pmatrix} 0 & \dots & -\infty \\ \vdots & \ddots & \vdots \\ -\infty & \dots & 0 \end{pmatrix}.$$

 $M_n(\mathbb{T})$  is referred to as a multiplicative monoid.

Any  $n \times n$  tropical matrix  $A := (a_{i,j})$  corresponds uniquely to the weighted digraph  $G_A = (V, E)$  defined to have vertex set  $V = \{1, \ldots, n\}$ , and an edge  $(i, j) \in E$  from i to j, of weight  $a_{i,j}$ , whenever  $a_{i,j} \neq -\infty$ .

For example:

$$A := \begin{pmatrix} a_{1,1} & a_{1,2} \\ -\infty & a_{2,2} \end{pmatrix} \quad \text{ corresponds to } \begin{array}{c} a_{1,1} & v_1 \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & &$$

The (i, j)-entry of  $A^k$  gives the highest weight of a walk from i to j of length k.

The entries of a matrix product AB correspond to labeled-weighted walks on the digraph  $G_{AB} = G_A \cup G_B$ . For example:

$$\begin{pmatrix} a_{1,1} & a_{1,2} \\ -\infty & a_{2,2} \end{pmatrix} \begin{pmatrix} b_{1,1} & b_{1,2} \\ -\infty & b_{2,2} \end{pmatrix} \Rightarrow a_{1,1} & v_1 \\ b_{1,1} & v_1 \\ a_{1,2} & v_2 \\ b_{2,2} & v_2 & a_{2,2} \end{pmatrix}$$

- The trace  $tr(A) = \sum_{i} a_{i,i}$  is the usual trace taken with respect to summation, although it corresponds to the tropical product of diagonal entries.
- The **permanent** of a matrix  $A := (a_{i,j})$  is defined as:

$$per(A) = \bigvee_{\pi \in \mathcal{S}_n} \sum_{i} a_{i,\pi(i)},$$

where  $S_n$  is the set of all permutations over  $\{1, \ldots, n\}$ .

The weight of a permutation  $\pi \in S_n$  is  $\omega(\pi) = \sum_i a_{i,\pi(i)}$ , so that  $per(A) = \bigvee_{\pi \in S_n} \omega(\pi)$ .

• A is nonsingular, if there exists a unique permutation  $\tau_A \in S_n$  that reaches per(A); that is,  $per(A) = \omega(\tau_A) = \sum_i a_{i,\tau_A(i)}$ . Otherwise, A is said to be singular.

The permanent is not multiplicative!

Ex. Take the nonsingular matrix

$$A = \begin{pmatrix} 0 & 0 \\ 1 & 2 \end{pmatrix}$$
 for which  $A^2 = \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$ .

Then  $per(A)^2 = 4$ ,  $per(A^2) = 5$ , and  $per(A^2) \neq per(A)^2$ .

Thm. (I., 2007) For any matrices  $A, B \in M_n(\mathbb{T})$ ,

 $\operatorname{per}(AB) \ge \operatorname{per}(A)\operatorname{per}(B).$ 

<ロト < 団 ト < 臣 ト < 臣 ト 三 12/35

If AB is nonsingular, then per(AB) = per(A) per(B) and  $\tau_{AB} = \tau_A \circ \tau_B$ .

The tropical rank rk<sub>tr</sub>(A) of A is the largest k for which A has a k × k nonsingular submatrix.

Equivalently,  $rk_{tr}(A)$  is the maximal number of independent columns (or rows) of A for an adequate notion of independence.

• The factor rank  $\operatorname{rk}_{\mathrm{fc}}(A)$  of A is the smallest k for which A can be written as A = BC with  $B \in M_{n,k}$  and  $C \in M_{k,n}$ .

Equivalently,  $\operatorname{rk}_{\operatorname{fc}}(A)$  is the minimal number of vectors whose tropical span contains the span of the columns (or rows) of A, or the minimal number of rank-one matrices  $A_i$  needed to write A additively as  $A = \bigvee_i A_i$ .

<ロト < 副 ト < 臣 ト < 臣 ト 三 2000 13/35 By definition, a matrix  $A \in M_n(\mathbb{T})$  is nonsingular iff  $\operatorname{rk}_{\operatorname{tr}}(A) = n$ . Tropical nonsingularity (and dependence) does not coincide with spanning.

For example, the vectors

$$\mathbf{v}_1 = (0, 0, -\infty), \quad \mathbf{v}_2 = (0, -\infty, 0), \quad \mathbf{v}_3 = (-\infty, 0, 0),$$

<ロト < 団 ト < 臣 ト < 臣 ト 三 2000 14/35

are dependent, but none of them can be written in terms of the others.

It is well known that the above notions of rank do not coincide. Nevertheless, the inequality

$$\operatorname{rk}_{\operatorname{tr}}(A) \leqslant \operatorname{rk}_{\operatorname{fc}}(A)$$

holds for every  $A \in M_n(\mathbb{T})$ .

Thm. (I., Merlet, 2018)

 $\operatorname{rk}_{\operatorname{fc}}(A^t) \leqslant \operatorname{rk}_{\operatorname{tr}}(A)$ 

<ロト < 団 ト < 臣 ト < 臣 ト 三 · 少。〇 15/35

for any  $A \in M_n(\mathbb{T})$  and  $t \ge (n-1)^2 + 1$ .

### Tropical Linear Representation

A finite dimensional tropical linear representation of a semigroup  $S:=(S,\cdot\ )$  is a semigroup homomorphism

$$\rho: S \longrightarrow M_n(\mathbb{T}), \qquad \rho(s's'') = \rho(s')\rho(s''), \ \forall s', s'' \in S,$$

where  $M_n(\mathbb{T})$  is realized as an associative semialgebra of linear operators acting on the space  $\mathbb{T}^n$ .

 $\rho$  is a **faithful representation**, if it is injective.

To prove that S satisfies a semigroup identity  $\Pi : u = v$ :

- Find a faithful tropical linear representation  $\rho$  of S,
- Use "tropical techniques" to prove the semigroup identity for  $\rho(S) \subset M_n(\mathbb{T}).$

<ロト < 聞 ト < 臣 ト < 臣 ト 三 2000 16/35

# Proving Identities of Tropical Matrices

To prove that a matrix subsemigroup  $\mathcal{M}_n \subset M_n(\mathbb{T})$  admits a given identity  $\Pi : u = v$  we have different approaches:

- To use generic matrices whose entries are variables, treated as functions.
- To realize matrices as labeled-weighted digraphs, and to compare walks on such graphs.
- To consider matrices as linear operators and to analyze their actions on the space.

<ロト < 団 ト < 臣 ト < 臣 ト 三 2000 17/35

#### Identities of Matrices

A matrix semigroup  $\mathcal{M}_n \subset M_n(\mathbb{T})$  satisfies the semigroup identity  $\Pi : u = v$ ,

if 
$$\varphi(u) = \varphi(v)$$
 for every morphism  $\varphi : \mathcal{A}^+ \longrightarrow \mathcal{M}_n$ ,

written  $u \llbracket A, B \rrbracket = v \llbracket A, B \rrbracket$  for any  $A, B \in \mathcal{M}_n$ .

Any semigroup identity  $\Pi : u = v$  of  $M_n(\mathbb{T})$ 

- is balanced the number of occurrences of each letter is the same in u and in v;
- is k-uniform each letter appears in u and v exactly k times;

<ロト<日、<日、<日、<日、<日、<日、<日、<日、<日、<日、<日、<日、<18/35

▶ is **uniform** – it is *k*-uniform for some *k*.

#### The Bicyclic Monoid

The **bicyclic monoid**  $\mathcal{B} = \langle p, q \rangle$  is the monoid generated by two elements p and q, satisfying the relation

$$pq = e$$
.

Each element w of  $\mathcal{B}$  can be written uniquely as

$$w = q^i p^j, \qquad i, j \in \mathbb{Z}_+$$

 $\mathcal{B}$  is faithfully represented by the map  $\rho: \mathcal{B} \to M_2(\mathbb{T})$ , given by

$$p \mapsto \begin{pmatrix} -1 & -1 \\ -\infty & 1 \end{pmatrix}, \quad q \mapsto \begin{pmatrix} 1 & -1 \\ -\infty & -1 \end{pmatrix}, \quad e \mapsto \begin{pmatrix} 0 & -2 \\ -\infty & 0 \end{pmatrix}.$$

◆□ → < □ → < Ξ → < Ξ → < Ξ → ○ 19/35 Thm. (Adjan 67) The bicyclic monoid  $\mathcal{B}$  satisfies the semigroup identity  $ab^2a \ ab \ ab^2a = ab^2a \ ba \ ab^2a.$ 

Therefore,  $M_2(\mathbb{T})$  has a nontrivial submonoid that admits a semigroup identity.

### Combinatorial Approach

Given two matrices  $A := (a_{i,j})$  and  $B := (b_{i,j})$ , we write

$$A \sim_{\text{diag}} B \iff a_{i,i} = b_{i,i}, \text{ for all } i = 1, \dots, n.$$

A and B are said to be **diagonally equivalent**, if  $A \sim_{\text{diag}} B$ . The products AB and BA of any two triangular matrices A and B is always diagonally equivalent:

$$AB \sim_{\text{diag}} BA.$$

<ロト < 団 ト < 臣 ト < 臣 ト 三 21/35

*Rem.* The digraph of a triangular matrix is acyclic.

### Combinatorial Approach

Let x = ab and y = ba. The Adjan's identity

$$ab^2a \underline{ab} ab^2a = ab^2a \underline{ba} ab^2a.$$

can be written as

$$xy \underline{x} xy = xy y xy.$$

Let  $X \sim_{\text{diag}} Y$  be diagonally equivalent matrices in  $M_2(\mathbb{T})$ . The (i, j)-entry of the matrix product  $XY\underline{X}XY$  corresponds to a labeled walk  $\gamma_{i,j}$  from i to j of highest weight and length 5 on  $G_{XY\underline{X}XY}$ .

Lem. (1., 2013) If the contribution of  $G_{\underline{X}}$  to a walk  $\gamma_{i,j}$  on  $G_{XY\underline{X}XY}$  is not a loop, then there is another walk  $\gamma'_{i,j}$  on  $G_{XY\underline{X}XY}$  from *i* to *j* of the same length and the same weight for which the contribution of  $G_X$  is a loop.

### $2 \times 2$ Tropical Matrices

Thm. (I., Margolis, 2009) The submonoid  $U_2(\mathbb{T})$  of upper triangular tropical matrices admits the Adjan's identity

$$ab^2a \underline{ab} ab^2a = ab^2a \underline{ba} ab^2a ,$$

i.e.,  $xy \underline{x} xy \llbracket AB, BA \rrbracket = xy \underline{y} xy \llbracket AB, BA \rrbracket$  for any  $A, B \in U_2(\mathbb{T})$ .

Thm. (I., Margolis, 2009) The monoid  $M_2(\mathbb{T})$  admits the identity

$$a^{2}b^{4}a^{2} \underline{a^{2}b^{2}} a^{2}b^{4}a^{2} = a^{2}b^{4}a^{2} \underline{b^{2}a^{2}} a^{2}b^{4}a^{2} ,$$

i.e.,  $xy \underline{x} xy \llbracket A^2 B^2, B^2 A^2 \rrbracket = xy \underline{y} xy \llbracket A^2 B^2, B^2 A^2 \rrbracket$  for any  $A, B \in M_2(\mathbb{T})$ .

<ロト < 団 ト < 臣 ト < 臣 ト 三 23/35

#### Power Words

Let  $\mathcal{A}$  be a finite (nonempty) alphabet, and let  $p, n \in \mathbb{N}_+$ .

Def. (1., 2013) A (p, n)-power word  $\widetilde{w}_{(p,n)}$  is a word in  $\mathcal{A}^+$  such that:

- (a) Each letter  $a_i \in \mathcal{A}$  may appear in  $\widetilde{w}_{(p,n)}$  at most p-times sequentially, i.e.,  $a_i^q \nmid \widetilde{w}_{(p,n)}$  for any q > p and  $a_i \in \mathcal{A}$ ;
- (b) Every word u ∈ A<sup>+</sup> of length n that satisfies rule (a) is a factor of w̃<sub>(p,n)</sub>.

 $\widetilde{w}_{(p,n)}$  is called an n-power word, if p = n.

A (p, n)-power word is **uniform**, if it is uniform as a word.

A (p, n)-power word needs not be unique in  $\mathcal{A}^+$ . Different (p, n)-power words may have different length, and they can be concatenated to a new (p, n)-power word.

<ロト < 団 ト < 臣 ト < 臣 ト 三 24/35

### Power Words

Ex. Let 
$$\mathcal{A} = \{x, y\}$$
.  
1. The 2-power word  $\widetilde{w}_{(2,2)} = x^2 y^2 x$  is not uniform, while

$$\widetilde{w}_{(2,2)} = yx^2y^2x$$

is uniform of length 6.

2.  $\widetilde{w}_{(2,3)}=xy^2xyx^2y$  is a uniform (2,3) -power word of length 8.  $\widetilde{w}_{(3,3)}=xy^3xyx^3y$ 

is a uniform 3-power word of length 10.

3. The word

$$\widetilde{w}_{(2,4)} = xyx^2y^2x^2yxy^2xyxy$$

is a uniform (2,4)-power word of length 16.

#### Semigroup Identities

Let  $\widetilde{w}_{(p,n)}$  be a uniform  $(p,n)\text{-power word over }\mathcal{A}=\{x,y\}$  such that the words

$$\widetilde{w}_{(p,n)} \ \underline{x} \ \widetilde{w}_{(p,n)}$$
 and  $\widetilde{w}_{(p,n)} \ \underline{y} \ \widetilde{w}_{(p,n)}$ 

are both (p, n)-power words.

Define the 2-letter identity

$$\Pi_{(p,n)}: \quad \widetilde{w}_{(p,n)} \ \underline{x} \ \widetilde{w}_{(p,n)} = \widetilde{w}_{(p,n)} \ \underline{y} \ \widetilde{w}_{(p,n)}.$$

<ロト < 団 ト < 臣 ト < 臣 ト 三 2000 26/35

To refine  $\Pi_{(p,n)}$  to a uniform identity, substitute x := ab and y := ba.

### Semigroup Identities

**Ex.** Let 
$$\mathcal{A} = \{x, y\}$$
.

1. Using the uniform 2-power word  $\widetilde{w}_{(2,2)}=yx^2y^2x$ , we obtain the identity

$$\Pi_{(2,2)}: \ yx^2y^2x \ \underline{x} \ yx^2y^2x = yx^2y^2x \ \underline{y} \ yx^2y^2x \ .$$

2. Taking the uniform 3-power word  $\widetilde{w}_{(3,3)}=xy^3xyx^3y$ , we obtain the identity

 $\Pi_{(3,3)}: \ xy^3xyx^3y \ \underline{x} \ xy^3xyx^3y = xy^3xyx^3y \ \underline{y} \ xy^3xyx^3y \ .$ 

<ロト < 団 ト < 臣 ト < 臣 ト 三 27/35

These identities become uniform by substituting x := ab, y := ba,

### **Triangular Matrices**

Think of  $\langle U \rangle = \widetilde{w}_{(n-1,n-1)} \llbracket X, Y \rrbracket$  as a word with letters  $X, Y \in M_n(\mathbb{T})$ , and let  $G_{\langle Z \rangle}$  be the labeled-weighted digraph of  $\langle Z \rangle = \langle U \rangle \underline{X} \langle U \rangle$ .

The (i, j)-entry of the matrix Z corresponds to a labeled walk  $\gamma_{i,j}$  on  $G_{\langle Z \rangle}$  from i to j of highest weight and length  $\ell(\langle Z \rangle)$ .

Lem. (1., 2013) Let  $X \sim_{\text{diag}} Y$  be diagonally equivalent matrices in  $M_n(\mathbb{T})$ . If the contribution of  $G_{\underline{X}}$  to  $\gamma_{i,j}$  is not a loop, then there is another walk  $\gamma'_{i,j}$  from i to j on  $G_{\langle Z \rangle}$  of the same length and the same weight for which the contribution of  $G_X$  is a loop.

<ロト < 団 ト < 臣 ト < 臣 ト 三 28/35

### **Tropical Triangular Matrices**

Thm. (I., 2013) Any two diagonally equivalent matrices  $X \sim_{\text{diag}} Y$  in  $U_n(\mathbb{T})$  satisfy the identity:

 $\Pi_{(m,m)}: \ \widetilde{w}_{(m,m)} \ \underline{x} \ \widetilde{w}_{(m,m)} = \widetilde{w}_{(m,m)} \ \underline{y} \ \widetilde{w}_{(m,m)},$ 

where  $\mathcal{A} = \{x, y\}$  and m = n - 1.

Ex. Diagonally equivalent matrices admit the following identities.
In U<sub>2</sub>(T)

$$xy \underline{x} xy = xy y xy.$$

• In  $U_3(\mathbb{T})$ 

$$yx^2y^2x \underline{x} yx^2y^2x = yx^2y^2x \underline{y} yx^2y^2x.$$

<ロト<団ト<臣ト<臣ト 29/35

### **Tropical Triangular Matrices**

Thm. (I., 2013) The submonoid  $U_n(\mathbb{T}) \subset M_n(\mathbb{T})$  of upper triangular tropical matrices satisfies the semigroup identity

$$\Pi_{(m,m)}: \ \widetilde{w}_{(m,m)} \ \underline{x} \ \widetilde{w}_{(m,m)} = \widetilde{w}_{(m,m)} \ \underline{y} \ \widetilde{w}_{(m,m)},$$

where  $\mathcal{A} = \{x, y\}$ , m = n - 1, by letting x = AB, y = BA, i.e.,

$$\widetilde{w}_{(m,m)} \ \underline{x} \ \widetilde{w}_{(m,m)} \ \llbracket AB, BA \, \rrbracket = \widetilde{w}_{(m,m)} \ \underline{y} \ \widetilde{w}_{(m,m)} \ \llbracket AB, BA \, \rrbracket \, .$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

## Nonsingular Matrix Subsemigroups

A matrix subsemigroup  $\mathcal{M}_n \subset M_n(\mathbb{T})$  is **nonsingular**, if each  $X \in \mathcal{M}_n$  is nonsingular.

Thm. (I., 2014) Any nonsingular subsemigroup  $\mathcal{M}_n \subset M_n(\mathbb{T})$  of tropical matrices satisfies the semigroup identities

$$\Pi_{(m,m)}: \ \widetilde{w}_{(m,m)} \ \underline{x} \ \widetilde{w}_{(m,m)} = \widetilde{w}_{(m,m)} \ \underline{y} \ \widetilde{w}_{(m,m)},$$

where  $\mathcal{A} = \{x, y\}$ , m = n - 1, by letting  $x = A^{n!}B^{n!}$ ,  $y = B^{n!}A^{n!}$ .

### **General Matrices**

Lem. (Shitov, 2015) Let  $A, B, C \in M_n(\mathbb{T})$  such that A = PQ, where  $P \in M_{n \times k}(\mathbb{T})$ ,  $Q \in M_{k \times n}(\mathbb{T})$ , k < n, and let  $w \in \{a, b\}^+$ . Then

 $(wa) \llbracket AB, AC \rrbracket = P(w \llbracket QBP, QCP \rrbracket) QB.$ 

Thm. (I., Merlet, 2018)  $\operatorname{rk}_{\operatorname{fc}}(A^t) \leq \operatorname{rk}_{\operatorname{tr}}(A)$  for any  $A \in M_n(\mathbb{T})$ and  $t \geq (n-1)^2 + 1$ .

Thm. (I., Merlet, 2018) The monoid  $M_n(\mathbb{T})$  satisfies a nontrivial semigroup identity for every  $n \in \mathbb{N}$ :

 $\langle ua, va \rangle \left[ \left( (qr)^t \right) \left[ a^{\overline{n}}, b^{\overline{n}} \right], \left( (qr)^t r \right) \left[ a^{\overline{n}}, b^{\overline{n}} \right] \right],$ 

with  $\overline{n} = \text{lcm}(1, ..., n)$ ,  $\langle q, r \rangle \in \text{Id}(U_n(\mathbb{T}))$ ,  $\langle u, v \rangle \in \text{Id}(M_{n-1}(\mathbb{T}))$ . The length of this identity grows with n as  $e^{Cn^2 + o(n^2)}$  for some  $C \leq 1/2 + \ln(2)$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

## **Digraph View**

Cor. (I., Merlet, 2018) For any labeled-weighted digraph G, having (parallel) arcs labeled by  $\{a, b\}$ , there exist two different labeling sequences  $u, v \in \{a, b\}^+$ , each determines a different labeled walk of length  $\ell(u) = \ell(v)$  between any pair of vertices of G, but with the same highest weight

#### The Plactic Monoid

The **plactic monoid**  $\mathcal{P}_n$  is the presented monoid  $\mathcal{A}_n^*/_{\equiv_{\mathrm{knu}}}$ , i.e., the free monoid  $\mathcal{A}_n^*$  over an ordered alphabet  $\mathcal{A}_n$  modulo the congruence  $\equiv_{\mathrm{knu}}$  determined by the **Knuth relations** 

$$a c b = c a b \quad \text{if} \quad a \leq b < c ,$$
  

$$b a c = b c a \quad \text{if} \quad a < b \leq c .$$
(KNT)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Thm. (I., 2016)  $\mathcal{P}_n$  has a tropical linear representation, which is faithful for n = 3.

Therefore,  $\mathcal{P}_3$  admits a nontrivial semigroup identity, for example

$$\Pi_{(2,2)}: \ yx^2y^2x \ \underline{x} \ yx^2y^2x = yx^2y^2x \ \underline{y} \ yx^2y^2x$$

with x = pq, y = qp, for  $p, q \in \mathcal{P}_3$ .
