

C++ Crash Course: Practical 1

1. Write a C++ program to print "hello world" to the screen.
2. Modify your program to declare a variable of type int, float, double and bool and print their values to screen. What are the default values assigned by the compiler? Does the bool type print what you expect?
3. Write a new C++ program to print out the numbers 1 to 10. What is the value of the loop variable outside of the loop?
4. Modify the previous program to print only numbers which are not 3, 8 or 9.
5. Modify the program to only print odd numbers.
