An introduction to Zappa-Szép Products

Rida-e-Zenab
Zappa-Szép product was developed by G Zappa in 1940. He is an Italian mathematician and a famous group theorist.

In 1941 Casadio and in 1950 Redei studied the variations and generalizations of Zappa-Szép products in setting of groups.

Redei, Szép and Tibiletti used these products to discover properties of groups in numerous papers. Szép introduced the relations of this product and used them to study structural properties of groups e.g., normal subgroups in 1950. He also initiated the study of similar products in setting other than groups in 1958 and 1968.

In 1950 Tolo studied factorizable semigroups which are internal Zappa-Szép products if factorizations are unique.

Zappa-Szép products in semigroup theory were introduced by M. Kunze in 1983.

Semidirect product

Definition

Let $G$ be a group with identity element $e$. Let $N$ be a normal subgroup of $G$ and $H$ be a subgroup of $G$. Then $G$ is said to be a *semidirect product* of $N$ and $H$ if the following hold.

1. $G = HN$ and
2. $N \cap H = \{e\}$.

It is denoted by

$$G = N \rtimes H.$$
Definition

Let $G$ be a group with identity element $e$, and let $H$ and $K$ be subgroups of $G$. THFAE

1. $G = HK$ and $H \cap K = \{e\}$
2. For each $g \in G$ there exists a unique $h \in H$ and unique $k \in K$ such that $g = hk$.

If either (and hence both) of these statements hold, then $G$ is said to be internal Zappa-Szép product of $H$ and $K$ and is denoted by $G = H \Join K$. 
Definition
Let $G$ be a group with identity element $e$, and let $H$ and $K$ be subgroups of $G$. THFAE

- $G = HK$ and $H \cap K = \{e\}$
- For each $g \in G$ there exists a unique $h \in H$ and unique $k \in K$ such that $g = hk$.

If either (and hence both) of these statements hold, then $G$ is said to be internal Zappa-Szép product of $H$ and $K$ and is denoted by $G = H \bowtie K$. 
Internal Zappa-Szép product

Definition
Let $G$ be a group with identity element $e$, and let $H$ and $K$ be subgroups of $G$. THFAE

- $G = HK$ and $H \cap K = \{e\}$
- For each $g \in G$ there exists a unique $h \in H$ and unique $k \in K$ such that $g = hk$.

If either (and hence both) of these statements hold, then $G$ is said to be internal Zappa-Szép product of $H$ and $K$ and is denoted by $G = H \bowtie K$. 
Definition
Let $H$ and $K$ be groups (and let $e$ denote each group’s identity element) and suppose we have bijective maps

$$H \times K \to H, \quad (h, k) \mapsto k \cdot h$$
$$H \times K \to K, \quad (h, k) \mapsto k^h$$

such that for all $h, h' \in H, k, k' \in K$,

(ZS1) $kk' \cdot h = k \cdot (k' \cdot h)$;
(ZS2) $k \cdot (hh') = (k \cdot h)(k^h \cdot h')$;
(ZS3) $(k^h)^{h'} = k^{hh'}$;
(ZS4) $(kk')^h = k^{k' \cdot h} k^{h'}$.
(ZS5) $k \cdot e_H = e_H$
(ZS6) $k^{e_H} = k$
(ZS7) $e_K \cdot h = h$
(ZS8) $e_K^h = e_K$
On the cartesian product $H \times K$, define a multiplication and an inversion map respectively,

$$(h, k)(h', k') = (h(k \cdot h'), k'h'k').$$

$$(h, k)^{-1} = (k^{-1} \cdot h^{-1}, (k^{-1})^{h^{-1}}).$$

Then $H \times K$ is a group, called \textit{external Zappa-Szép product} of groups $H$ and $K$ and denoted by $H \Join K$.

The subsets $H \times \{e\}$ and $\{e\} \times K$ are subgroups isomorphic to $H$ and $K$, respectively, and $H \Join K$ is, in fact, an internal Zappa-Szép product of $H \times \{e\}$ and $\{e\} \times K$. 

On the cartesian product $H \times K$, define a multiplication and an inversion map respectively,

$$(h, k)(h', k') = (h(k \cdot h'), k'h').$$

$$(h, k)^{-1} = (k^{-1} \cdot h^{-1}, (k^{-1})^{h^{-1}}).$$

Then $H \times K$ is a group, called external Zappa-Szép product of groups $H$ and $K$ and denoted by $H \troline K$.

The subsets $H \times \{e\}$ and $\{e\} \times K$ are subgroups isomorphic to $H$ and $K$, respectively, and $H \troline K$ is, in fact, an internal Zappa-Szép product of $H \times \{e\}$ and $\{e\} \times K$. 

Example 1
Let $G = GL(n, C)$, the general linear group of invertible $n \times n$ matrices over the field of complex numbers. For each matrix $A$ in $G$, the QR decomposition asserts that there exists a unique unitary matrix $Q$ and a unique upper triangular matrix $R$ with positive real entries on the main diagonal such that $A = QR$. Thus $G$ is a Zappa-Szép product of the unitary group $U(n)$ and the group (say) $K$ of upper triangular matrices with positive diagonal entries.
Example 2

One of the most important examples of Zappa-Száp product is Hall’s 1937 theorem on the existence of Sylow systems for soluble groups. This shows that every soluble group is a Zappa-Száp product of a Hall $p$-subgroup and a Sylow $p$-subgroup, and in fact that the group is a (multiple factor) Zappa Szép product of a certain set of representatives of its Sylow subgroups.
The concept of Zappa-Szép product in semigroups was introduced by M. Kunze in 1983. He investigated their role in transformation monoids and automata theory. He gave applications of Zappa-Szép product to translational hulls, Bruck-Reilly extensions and Rees matrix semigroups. In 1992 Kunze used the terminology Bilateral semigroup for Zappa-Szép product and studied aperiodic transformation semigroups \((X, S)\) and investigated a strong decomposition of its elements out of idempotents.
Let $S$ and $T$ be semigroups and suppose we are given functions
\[ S \times T \to S, \quad (s, t) \mapsto t \cdot s \in S \quad \to (1) \]
and
\[ S \times T \to T, \quad (s, t) \mapsto t^s \in T \quad \to (2) \]
where $s \in S$ and $t \in T$, satisfying the Zappa-Szép rules (ZS1),
(ZS2), (ZS3) and (ZS4) developed by G. Zappa. Then the set $S \times T$
with the product defined by:

\[(s, t)(s', t') = (s(t.s'), t^st')\]

is a semigroup, called external Zappa-Szép product of $S$ and $T$,
which is written as $S \triangleright◁ T$.

A semigroup $S$ is called internal Zappa-Szép product of subsemiroups
$A$ and $B$, if each $s \in S$ is uniquely expressible as $s = ab$. 
Let $S$ and $T$ be semigroups and suppose we are given functions

$$S \times T \rightarrow S, \ (s, t) \mapsto t \cdot s \in S \quad \text{---(1)}$$
$$S \times T \rightarrow T, \ (s, t) \mapsto t^s \in T \quad \text{---(2)}$$

where $s \in S$ and $t \in T$, satisfying the Zappa-Szép rules (ZS1), (ZS2), (ZS3) and (ZS4) developed by G. Zappa. Then the set $S \times T$ with the product defined by:

$$(s, t)(s'.t') = (s(t.s'), t^s.t')$$

is a semigroup, called external Zappa-Szép product of $S$ and $T$, which is written as $S \Join T$.

A semigroup $S$ is called internal Zappa-Szép product of subsemiroups $A$ and $B$, if each $s \in S$ is uniquely expressible as $s = ab$.

An introduction to Zappa-Szép products
External and internal Zappa-Szép product of monoids

Definition

If $S$ and $T$ are monoids with identities $1_S$ and $1_T$ respectively, then external and internal Zappa-Szép products of $S$ and $T$ are defined as above for semigroups satisfying axioms (ZSI) to (ZS8) developed by G Zappa.

$S \times T$ is a monoid with identity $(1_S, 1_T) \in S \times T$.

Theorem

$M = S \triangleleft T$ is the external Zappa-Szép product of monoids $S$ and $T$ if and only if $M = \bar{S} \bar{T}$ is the internal Zappa-Szép product of submonoids $\bar{S}$ and $\bar{T}$ isomorphic to $S$ and $T$ respectively.
External and internal Zappa-Szép product of monoids

Definition

If $S$ and $T$ are monoids with identities $1_S$ and $1_T$ respectively, then external and internal Zappa-Szép products of $S$ and $T$ are defined as above for semigroups satisfying axioms (ZSI) to (ZS8) developed by G Zappa.

$S \times T$ is a monoid with identity $(1_S, 1_T) \in S \times T$.

Theorem

$M = S \bowtie T$ is the external Zappa-Szép product of monoids $S$ and $T$ if and only if $M = \bar{S} \bar{T}$ is the internal Zappa-Szép product of submonoids $\bar{S}$ and $\bar{T}$ isomorphic to $S$ and $T$ respectively.
Theorem

Let \( M = S \bowtie T \) be a Zappa-Szép product of \( S \) and \( T \). Then for \( s_1, s_2 \in S, t_1, t_2 \in T \)

- \((s_1, t_1) \triangleright (s_2, t_2) \implies s_1 \triangleright s_2 \) in \( S \).
- \((s_1, t_1) \triangleleft (s_2, t_2) \implies t_1 \triangleleft t_2 \) in \( T \).
- \((s_1, t_1) \nleq \triangleright (s_2, t_2) \implies s_1 \nleq \triangleright s_2 \) in \( S \).
- \((s_1, t_1) \nleq \triangleleft (s_2, t_2) \implies t_1 \nleq \triangleleft t_2 \) in \( T \).
Theorem

Let \( M = S \bowtie T \) be a Zappa-Szép product of \( S \) and \( T \). Then for \( s_1, s_2 \in S, t_1, t_2 \in T \)

- \((s_1, t_1) \geq_{\mathcal{R}} (s_2, t_2) \implies s_1 \geq_{\mathcal{R}} s_2 \) in \( S \).

- \((s_1, t_1) \leq_{\mathcal{L}} (s_2, t_2) \implies t_1 \leq_{\mathcal{L}} t_2 \) in \( T \).

- \((s_1, t_1) \leq_{\mathcal{R}} (s_2, t_2) \implies s_1 \leq_{\mathcal{R}} s_2 \) in \( S \).

- \((s_1, t_1) \geq_{\mathcal{L}} (s_2, t_2) \implies t_1 \geq_{\mathcal{L}} t_2 \) in \( T \).
Properties of Zappa-Szép product of monoids

**Theorem**

Let $M = S \rtimes T$ be a Zappa-Szép product of $S$ and $T$. Then for $s_1, s_2 \in S$, $t_1, t_2 \in T$

- $(s_1, t_1) \mathcal{R} (s_2, t_2) \implies s_1 \mathcal{R} s_2$ in $S$.
- $(s_1, t_1) \mathcal{L} (s_2, t_2) \implies t_1 \mathcal{L} t_2$ in $T$.
- $(s_1, t_1) \preceq \mathcal{R} (s_2, t_2) \implies s_1 \preceq \mathcal{R} s_2$ in $S$.
- $(s_1, t_1) \preceq \mathcal{L} (s_2, t_2) \implies t_1 \preceq \mathcal{L} t_2$ in $T$. 

(Rida-e-Zenab)
Properties of Zappa-Szép product of monoids

**Theorem**

Let $M = S \bowtie T$ be a Zappa-Szép product of $S$ and $T$. Then for $s_1, s_2 \in S, t_1, t_2 \in T$

- $(s_1, t_1) \mathcal{R} (s_2, t_2) \iff s_1 \mathcal{R} s_2$ in $S$.
- $(s_1, t_1) \mathcal{L} (s_2, t_2) \iff t_1 \mathcal{L} t_2$ in $T$.
- $(s_1, t_1) \preceq \mathcal{R} (s_2, t_2) \iff s_1 \preceq \mathcal{R} s_2$ in $S$.
- $(s_1, t_1) \preceq \mathcal{L} (s_2, t_2) \iff t_1 \preceq \mathcal{L} t_2$ in $T$. 
Transformation monoids

Let $S$ be a transformation monoid acting on a set $T$ where $T$ is a right zero semigroup. Defining action of $S$ on $T$ by $(s, t) \rightarrow t^s = ts \in T$ and the action of $T$ on $S$ by $(s, t) \rightarrow t \cdot s = 1_S \in S$, we get the external Zappa-Szép product $M = S \ltimes T$ with binary operation

$$(s, t)(s', t') = (s, t')$$

On the other hand, if we consider $T$ as a left zero semigroup and define $(s, t) \rightarrow t \cdot s = s \in S$ and $(s, t) \rightarrow t^s = ts \in T$ we obtain a Zappa-Szép product with multiplication

$$(s, t)(s', t') = (ss', ts').$$
The Bruck-Reilly extension of a monoid
Let $S$ be a monoid and $\theta$ be an endomorphism of it. The Bruck-Reilly extension $BR(S, \theta)$ consists of triples $(k, s, m)$, where $k$ and $m$ are natural numbers and $s \in S$.

Kunze discovered that $BR(S, \theta)$ is the Zappa-Szép product of $(N, +)$ and semidirect product, $N \rtimes S$, where multiplication in $N \rtimes S$ is defined by the following rule

$$(k, s) \cdot (l, t) = (k + l, (s\theta^l)t).$$

Define for $m \in N$ and $(l, s) \in N \rtimes S$

$$m \cdot (l, s) = (g - m, s\theta^{g-l}) \quad \text{and} \quad m^{(l,s)} = g - l$$

where $g$ is greater of $m$ and $l$. Then $(N \rtimes S) \rtimes N$ is Zappa-Szép product with composition rule

$$[(k, s), m] \circ [(l, t), n] = [(k - m + g, s\theta^{g-m}t\theta^{g-l}), n - l + g],$$

where again $g$ is greater of $m$ and $l$. 
Rees matrix semigroups

Consider a Rees matrix semigroup $M^0[G, I, \Lambda, P]$. Kunze canonically extended $M^0[G, I, \Lambda, P]$ to a Rees matrix semigroup $M^0[G, I', \Lambda', P']$, where $I' = I \cup \{\ast\}$, $\Lambda' = \Lambda \cup \{\ast\}$ and

$$p'_{\lambda i} = \begin{cases} p_{\lambda i} & \text{if } \lambda \in \Lambda, i \in I \\ 1 & \text{otherwise} \end{cases}$$

Then $S = \{(i, 1, \ast) \mid i \in I'\}$ and $T = \{(*, a, \lambda) \mid a \in G, \lambda \in \Lambda'\}$ are subsemigroups of $M^0[G, I', \Lambda', P']$, because $p_{\ast j} = 1$.

Now if $I'$ is left zero-semigroup and $\Lambda'$ is right zero semigroup, then clearly $S \cong I'$ and $T \cong G \times \Lambda'$, because $p_{\lambda \ast} = 1$.

Furthermore every element $(i, a, \lambda) \in M^0[G, I', \Lambda', P'] \setminus \{0\}$ is uniquely represented as a product in $S \cdot T$.

Thus $M^0[G, I', \Lambda', P']$ is a Zappa-Szép product of $S$ and $T$, with action of $S$ on $T$ and $T$ on $S$ defined by

$$ (a, \lambda)^j = (ap_{\lambda j}, \ast) \text{ and } (a, \lambda) \cdot j = \ast \text{ respectively.} $$
Proposition 1

Let $S \bowtie T$ be a Zappa-Szép product of semigroups $S$ and $T$. Let $\sim_1$, $\sim_2$ be congruences on $S$ and $T$ respectively. Define $\sim$ on $S \bowtie T$ by

$$(s, t) \sim (s', t') \iff s \sim_1 s' \land t \sim_2 t'.$$

Then $\sim$ is a congruence on $S \bowtie T$ if

$$s \sim_1 s' \land t \sim_2 t' \Rightarrow \left\{ \begin{array}{l}
t \cdot s \sim t' \cdot s' \\
t^s \sim t'^s'
\end{array} \right\}.$$

For Zappa-Szép product of monoids the converse is also true.

If $\star$ is valid, then $(S \bowtie T/ \sim) \cong (S/ \sim) \bowtie (T/ \sim)$ for appropriately defined functions (1) and (2) on $(S/ \sim) \bowtie (T/ \sim)$. 
Proposition 2

Let $S \Join T$ be a Zappa-Szép product of monoids and $\sim$ a congruence relation on $T$ such that

$$t \sim t' \Rightarrow t^s \sim t'^{s'}$$
for every $s \in S$.

Define an equivalence on $S$ by

$$s \approx s' \iff \forall t \in T : t^s \sim t'^{s'}.$$

If $T/\sim$ is right cancellative, $(s, t) \sim (s', t') \iff s \approx s' \land t \sim t'$ is a congruence on $S \Join T$. 
Example

As an example for a situation dual to above proposition take $T = A^*$ and $S$ as the set of states for an accepting automaton $A = (A, S, \delta, q_0, F)$ for a language $L \subseteq A^*$. Equip $S$ with right zero multiplication to fulfill additional assumption of Proposition (2). Put

$$a^s = 1, a.s = \delta(a, s)$$

where $\delta$ is state transition function of $A$, and consider an equivalence $\sim$ on $S$ satisfying

$$s_1 \sim s_2 \text{ implies } \delta(w, s_1) \in F \iff \delta(w, s_2) \in F$$

for every $w \in A^*$. If $\sim$ is equality, then $A^*/\sim$ is the transition monoid of $A$. If $\sim$ is coarsest possible equivalence, then $A^*/\sim$ is the syntactic monoid of $L$. 
The (internal) Zappa-Szép product $M = A \bowtie B$ of the regular subsemigroups (submonoids) $A$ and $B$ need not be regular in general. Following is an example related to this situation.

**Example**
Let $A = \{1, e, f\}$ where $e^2 = e$, $f^2 = f$, $ef = f = fe$ and $B = \{1, b\}$ where $b^2 = b$. Suppose $1 \in A$ act trivially on $B$, so that

$$1^e = 1^f = 1, \quad b^e = b^f = 1$$

and $1 \in B$ act trivially on $A$, that is

$$b \cdot 1 = 1, \quad b \cdot e = f, \quad b \cdot f = f.$$ 

Then $A$ and $B$ are regular monoids.
Regular Zappa-Szép product

We have following multiplication table:

<table>
<thead>
<tr>
<th></th>
<th>(1, 1)</th>
<th>(1, b)</th>
<th>(e, 1)</th>
<th>(e, b)</th>
<th>(f, 1)</th>
<th>(f, b)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1, 1)</td>
<td>(1, 1)</td>
<td>(1, b)</td>
<td>(e, 1)</td>
<td>(e, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
</tr>
<tr>
<td>(1, b)</td>
<td>(1, b)</td>
<td>(1, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
</tr>
<tr>
<td>(e, 1)</td>
<td>(e, 1)</td>
<td>(e, b)</td>
<td>(e, 1)</td>
<td>(e, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
</tr>
<tr>
<td>(e, b)</td>
<td>(e, b)</td>
<td>(e, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
</tr>
<tr>
<td>(f, 1)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
</tr>
<tr>
<td>(f, b)</td>
<td>(f, b)</td>
<td>(f, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
<td>(f, 1)</td>
<td>(f, b)</td>
</tr>
</tbody>
</table>

From the table we see that multiplication is associative. Then $M = A \Join B$ is Zappa-Szép product of $A$ and $B$ which is not regular, since $(e, b)$ is not a regular element. Moreover

$$E(M) = \{(1, 1), (1, b), (e, 1), (f, 1), (f, b)\}$$

which is not a subsemigroup of $M$, since $(e, 1)(1, b) = (e, b) \notin E(M)$. 
Regular Zappa-Szép product

Proposition
If $A$ is regular monoid, $B$ is a group, $1_B \cdot a = a, (1_B)^a = 1_B$, for all $a \in A$, then $M = A \uplus B$ is regular.

Proposition
Let $A$ be a left zero semigroup and $B$ be a regular semigroup. Suppose for all $b \in B$, there exists some $a \in A$ such that $b^a = b$, and for all $x \in A$, there exists some $b' \in V(b)$ such that $(b')^x = b'$. Then $M = A \bowtie B$ is regular.
The semidirect product of inverse semigroups/monoids need not be inverse in general. We see it from the following example.

**Example** Let $S = \{1, a\}$ be the commutative monoid with one non-zero-identity idempotent $a$. Let $T = \{1, e, 0\}$ be the commutative monoid with zero and $e = e^2$.

Then $S$ and $T$ are both inverse monoids, and there is a homomorphism

$$
\theta : S \to \text{End}(T) \text{ given by}
1^a = 1, \ e^a = 0^a = e.
$$

Then $P = S \rtimes T$ is regular. However the element $(a, e) \in P$ has two inverses, $(a, e)$ and $(a, 0)$.

Hence $P$ is not inverse monoid.
A complete characterization of semidirect product of inverse monoids is given by *W.R. Nico* in 1983.

**Theorem**

A semidirect product \( P = S \rtimes T \) of two monoids \( S \) and \( T \) determined by the homomorphism \( \theta : S \to \text{End}(T) \) will be an inverse monoid if and only if,

(i) \( S \) and \( T \) are inverse monoids.

(ii) For every \( e = e^2 \in S, \theta(e) = 1 \in \text{End}(T) \), i.e \( t^e = t \) for all \( t \in T \).
Inverse Zappa-Szép product

The Zappa-Szép product $P = S \bowtie T$ of inverse semigroups $S$ and $T$ need not be inverse in general as we can see from following example.

**Example**

Let $S = \{e, f, ef\}$, where $e^2 = e$, $f^2 = f$, $ef = fe$ and $T = \{1, a, b, ab\}$, where $a^2 = 1$, $b^2 = 1$, $ab = ba$.

Suppose that action of $T$ on $S$ defined by

- $a \cdot e = f$, $b \cdot e = f$, $a \cdot f = e$, $b \cdot f = e$

and $1 \in T$ act trivially. The action of $S$ on $T$ defined by

- $a^e = f$, $b^e = b$, $a^f = b$, $b^f = b$.

Thus $S$ and $T$ are inverse but $P = S \bowtie T$ is not inverse.
Suha wazan has given necessary condition for the Zappa-Szép product of inverse semigroups to be inverse in the following Proposition:

Proposition
The Zappa-Szép product $P = S \trianglerightleftharpoonup T$ of $S$ and $T$ is inverse semigroup if and only if, 
(i) $S$ and $T$ are inverse semigroups, 
(ii) $E(S)$ and $E(T)$ act trivially, 
(iii) If $p = st \in E(P)$, then $s$ and $t$ act trivially on each other.
